

Carbon Cycle Reading & Diagram

Summary

Students will read a text selection about the carbon cycle and try to create a diagram.

Time Frame

1 class periods of 60 minutes each

Group Size

Individual

Materials

- [carbon cycle illustration](#)
(attached)
large construction paper
colored pencils, markers, crayons
- [student worksheet](#)
(attached)

Background for Teachers

This could be used as an introductory activity or as a review activity.

Instructional Procedures

Hand out student sheet (attached).

Go over procedures and explain expectations for the drawing. (If using as a final or review project, you may want to have a rubric or explain quality expectations.)

Give students time to work

Good follow-up would be to have students take turns drawing different parts of the carbon cycle on the board or an overhead. Help add in information where necessary, and have students add to their drawing. You can use the illustration provided (attached) as a guide and have students compare and make adjustments to their drawing.

Extensions

Assign students to make some sort of 3D display of the carbon cycle like a diorama or mobile.

Students could write a story or narrative to go along with the display. You could give students one day for planning and preparation, one day for building and one day for presenting.
