### COLOR DISTRIBUTION CHART

Divide a room into seven areas of color, noting the percentage of the room each color will cover. Remember the law of color distribution: bright colors weigh heavily in their power to attract attention and can balance much larger areas of grayed color.

1. Select a color to be used in the largest areas. (It is best to keep this color more neutral because it covers the largest area.)
2. Select the colors in tints or shades to be used in the next largest areas.
3. Select one or two colors that can be used as accents and accessory colors.
