Weighing In

Summary
This classroom activity will help students understand gravity.

Main Core Tie
Science - 3rd Grade
Standard 4 Objective 1

Group Size
Large Groups

Materials
- golf ball
- one sheet of ditto paper
- assorted classroom objects
- spring scale (0-2000 grams)

Background for Teachers
The Earth’s gravity pulls everything towards its center. Gravity gives objects their weight. The weight of an object is a measure of the pull of gravity on that object.

Intended Learning Outcomes
1. Use a Science Process and Thinking Skills
2. Manifest Science Interests and Attitudes
3. Understand Science Concepts and Principles
4. Communicate Effectively Using Science Language and Reasoning

Instructional Procedures
Invitation to Learn
Double Drop

Hold a sheet of paper and a ball at the same height.
Drop them. (Aristotle’s hypothesis predicts that the ball lands on the floor before the sheet of paper because the ball is heavier. And sure enough, the ball does land first, but not because of Aristotle's hypothesis.)

Crumple the paper into a wad - the same size as the ball.
Hold the wad and the ball at the same height and drop them.
Discuss what is happening. The ball and the paper land at the same time. The paper hasn't gotten any heavier; it's just a different shape. A round wad of paper can push air out of the way more quickly than a flat sheet of paper. If there was no air to push out of the way (air resistance) even the sheet of paper would plummet at the same speed as the ball.

Instructional Procedures
Estimate the order of the weight of various classroom objects from lightest to heaviest.
Measure the weight of each object using the spring scale.
Compare the actual results with the estimates in step one.
Place the objects in the correct order from lightest to heaviest.

Curriculum Integration
Math/Science
Objective 1:3 Identify the relationship between whole numbers
   Place the objects in sequence according to their weight from lightest to heaviest.
   Order and compare the weights of the objects by plotting them on a number line.
   Compare the relationship ("<", ">" and "=") between the weights of the objects.

Objective 3:2 Describe spatial relationships.
   Make a grid of the floor tiles (flight path) and indicate where the paper airplane landed.

Extensions
Put one cup of various items (marshmallows, gravel, rice, beans, cereal, etc.) into individual sturdy cups. Have the students complete the instructional procedures above for these items.

Adaptation: The main activity and the extension can be investigated by the students individually or in small groups at a learning station, or cooperatively by the whole class.

Homework & Family Connections
Defying Gravity
   Challenge the students to design and make a paper airplane that will defy gravity, by flying in the straightest and furthest path.
   Have the students bring their airplanes to school the next day for test flights.
   Have one student at a time fly their airplane. This is best done in a hall with tile on the floor.
   Record the results. To determine each student's result: Count the number of tiles out from the starting line. Then, subtract the number of tiles off course (to the left or right).
   Analyze which airplanes were the most successful in meeting the criteria and why.
   Are there some variables in the experiment that could possibly influence the results? How could we control those variables?

Assessment Plan
Did the student(s) accurately read the spring scale?
Did the student(s) place the objects in the correct sequence from lightest to heaviest?
